Decisions.

1. Acquiring advertising intelligence, not just website summarisation

I didn't want the research stage to return a generic summary of an ecommerce website. I structured the output into four distinct areas: Brand Identity, Target Audience, Brand Voice & Messaging, and Visual Identity.

The distinction matters because each section serves a different purpose later in the creative process. Brand positioning informs the advertising angle, audience motivations inform the messaging, and visual identity informs the image-generation direction.

I also separated verified brand information from inferred audience insights. For example, Gymshark's messaging and displayed offers come from its website, whereas customer motivations are AI-generated interpretations.

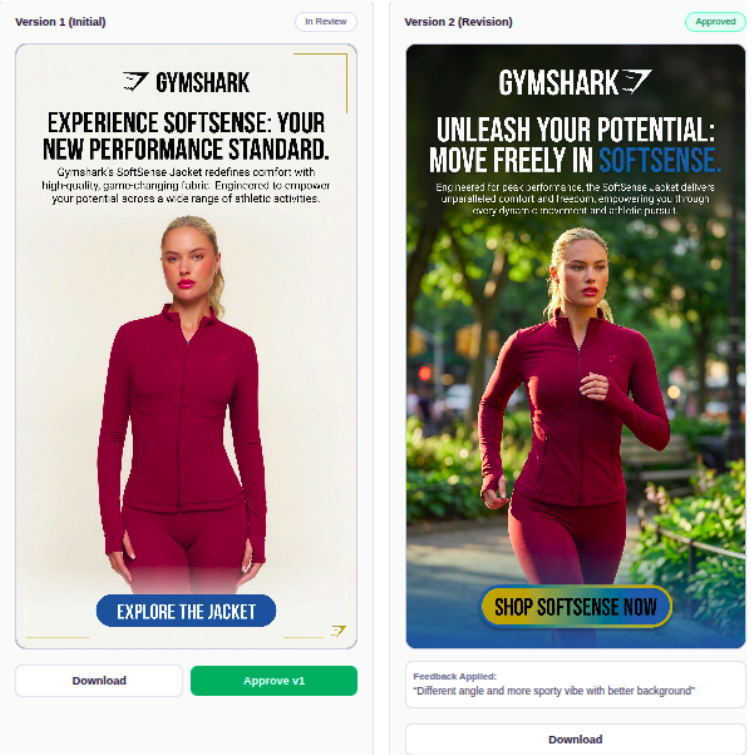

2. I made creative iteration version-based and feedback-driven

I didn't want a new generation request to overwrite the previous advertisement.

The system preserves creative versions so users can compare previous and revised outputs. For example, after generating Version 1, a user can request a different angle, a sportier atmosphere or a better background and generate another version.

The revision also retains the original product reference. This is important because changing the visual direction should not mean losing track of the product being advertised.

I chose version history because creative work is iterative, and users should be able to compare and approve a particular result rather than only seeing the latest generation.

3. User in the Loop at 2 Stages

For example, the research stage discovered 18 products. The user can select a specific product, such as the SoftSense Jacket, before moving into concept development.

This also gives the user control over which product is being advertised instead of letting the agent make that decision.

& Another Key decision by the user will be deciding concept & Ad.

4. structured concept generation around distinct advertising angles

Rather than generating three slightly different image prompts, I wanted the concepts to represent different reasons a customer might purchase the same product.

For the SoftSense Jacket, Agent developed three directions:

- Unleash Your Movement — focused on unrestricted movement.
- Engineered for SoftSense Comfort — focused on comfort and product experience.
- Your Everyday Essential — focused on everyday use and lifestyle.

Each concept contains its own headline, supporting copy, CTA and visual direction.

I chose this structure because it gives the user a meaningful creative choice before spending resources on image generation. The user can also request new angles or switch products without treating the entire research process as a new campaign.

5. I kept creative strategy separate from visual generation

I didn't want the image-generation model to independently decide the advertising message, product positioning and visual composition.

I separated the process into two stages. agent develops the creative direction, while the image-generation provider receives the selected product reference and the creative instructions.

This gives the generation stage a more structured input: the product being advertised, the selected advertising angle, the headline, the CTA and the desired visual treatment.
